

TITLE: Winter Wheat, Spring Wheat, Spring Durum, Spring Barley and Safflower Variety Performance Evaluations Under Dryland Chemical Fallow Conditions On-Station at Northern Agricultural Research Center, Havre, Montana. 2011-2020.

PROJECT LEADER: Peggy Lamb, Research Scientist, Havre

PROJECT PERSONNEL:

Kyla McNamara, Research Associate, Havre
Eleri Haney, Research Associate, Havre
Phil Bruckner, Winter Wheat Breeder/Geneticist, Bozeman
Phil Bruckner, Interim Spring Wheat Breeding Program Coordinator, Bozeman
Jamie Sherman, Spring Barley Breeder/Geneticist, Bozeman
Mike Giroux, Durum Breeder/Geneticist, Bozeman
Jim Berg, Winter Wheat Research Associate, Bozeman
Hwa-young Heo, Spring Wheat Research Associate, Bozeman
Greg Lutgen, Barley Research Associate, Bozeman
Andy Hogg, Durum Research Associate, Bozeman
Jerald Bergman, Safflower Breeder/Agronomist, Williston, ND

Content:

This report is intended to serve as a popularized 2020 summary of “primary” on-going cereal and oilseed crop variety investigations traditionally conducted on-station by the Variety Testing Program at Northern Agricultural Research Center. These data represent approximately 16 percent of NARC Variety Testing Programs total research project effort on-station at Havre. The remaining 84 percent of the research not reported here includes cultivar and product evaluations associated with larger nurseries featuring early generation or other unnamed experimental materials not of general interest to the public; and/or experimental seed treatment, specialty crop, forage, fertility, fungicide and insecticide evaluations. Long-term data summaries reported here are limited to the most recent ten years. This is largely due to need for report brevity and the fact that most varieties have approximately a 10-year life span before they are replaced in common use with newer materials having superior production characteristics. Variety performance data has been continuously collected and maintained at the Havre station for 105 years beginning in 1916. Collection of wheat stem sawfly cutting data was added beginning in 2003.

Detailed data pertaining to multiple performance characters, along with associated climatic and management inputs are presented for 2020. Abridged, multi-year summaries for each wheat cereal trial are limited to four crop characters (yield, test weight, protein and sawfly rating) while the safflower summary is limited to two crop characters (yield and oil content). Individuals desiring detailed data for other than the current year may contact the research center or refer to previous editions of this report for the year(s) of interest.

2020 Data:

It should be noted that 2020 data tables in this report represent varietal performance for a single crop year at a single location only, and thus cannot be considered representative of performance expected when differing conditions due to location, year and management are imposed. Therefore, by itself, 2020 data shall not constitute in any form a recommendation for or against any entry or practice included.

Please note that research trial seed yield results recorded under wheat stem sawfly pressure are likely much higher than a producer should expect. Small plot variety trials are managed to assess maximum yield potential and are harvested in such a way that all stems and heads are picked up by the combine, regardless of lodging or cutting due to sawfly. Pickup guards coupled with an extremely slow ground speed and an exceptionally low cutting height help researchers collect all heads in order to assess seed yield potential. If you are a producer in a wheat stem sawfly environment, although hollow stemmed varieties may be high yielding in research trials in your area, we strongly recommend against growing those hollow stemmed varieties. Please be aware that if you seed hollow stemmed varieties with sawfly present, you are only creating a breeding ground for future generations of sawfly in your area and not helping combat the pest population.

Crop year 2020 was nearly on par with the long-term temperature average for the year, however, April was five degrees cooler than normal, delaying ideal soil temperatures for seeding. Spring and summer months during the growing season had below average precipitation, however late June rainfall coupled with below average temperatures in July resulted in better than anticipated spring crop yields in north central Montana. At Havre, annual

growing season precipitation (9/1/19 through 8/31/20) was 10.52 inches, 1.53 inches lower than the average for all years since 1916. April 1 through July 31 precipitation was 5.55 inches, or 82 percent of the 105-year average. Heat units expressed as "Growing Degree Days" (GDD, base 50) from May through July totaled 1220, or 95 percent of the average for the last 70 years (1951-2020). The last spring frost was on May 12 and the first fall frost of 2020 was on October 1, resulting in 142 frost-free days. The minimum winter temperature was -24 degrees F on January 16, 2020. Overall, the 2019-2020 average crop year temperatures were 0.3 degrees F warmer than the long-term average. The April through July growing season saw an average daily temperature of 57 degrees F, 1.4 degrees F lower than historical temperatures. July and August temperatures were higher than the long-term averages, with the high for 2020 recorded on August 18 at 99 degrees F. There were 19 days with temperatures 90 degrees F or above, with no days over 100 degrees F.

Multi-Year Summary Data:

Use of a "Comparable Average" provides a mechanism for "estimating" the performance of varieties over a period of time longer than that for which actual data is available for them. This is accomplished by comparing the performance of a "variety of interest" for the years it was actually tested with that of a designated "check" or reference variety grown in the same trial in the same years. The performance of the variety of interest is then expressed as a percentage of the check variety's performance. This actual percentage or index is then applied to the actual long-term performance of the check to estimate the performance of the variety of interest had it been grown over the same long term. The reliability of comparable average figures improves with increasing years of actual evaluation, so no entries with less than three years of actual data have been included in long-term summaries.

Other References:

It is intended that this report be used as a supplement to variety performance summaries prepared by MSU's Plant Science and Plant Pathology Department on statewide evaluations by the Montana Agricultural Experiment Station:

- Winter Wheat Varieties, Extension Service 2B 1098 (Revised February-March annually)
- Spring Wheat Varieties, Extension Service 2B 1093 (Revised February-March annually)
- Barley Varieties, Extension Service 2B 1094 (Revised February-March annually)

These summaries include performance data, descriptions, quality assessments, disease and insect considerations, cropping district recommendations, cultural practices, and general crop production management information. These publications are available from MSU-Extension Service offices and can further be accessed via the Internet at <https://plantsciences.montana.edu/crops/index.html>.

Recognition:

This research would not have been possible without the assistance of the following seasonal employees:
Peyton Brown, Jonathan Erickson, Daisen Fox, Faith Gasvoda, Isabella Lawless, Tracey Reed, Erin Taylor and Ivy Thomas.

2018: 1198 single row plots along with individual hill plots are no longer included in count

2019: 1398 single row plots along with individual hill plots are no longer included in count

2020: 1703 single row plots along with individual hill plots are no longer included in count

2020 SUMMARY: Project Inventory - (Plots Established)

TOTALS - AGRONOMY & LIVESTOCK PROJECTS

61 Experiments or Trials
3212 Entries in 6234 Plots
4531 Plots for Harvest

GEOGRAPHIC DISTRIBUTION OF PLOT WORK: (by plot count only, not by resources expended. Demos not included.)

| | | |
|-------------|---|--------|
| ON-STATION | = | 60.06% |
| OFF-STATION | = | 39.94% |

(Percent of TOTAL OFF-STATION by County): (by plot count only, not by resources expended. Demos not included.)

| | | | | |
|-------------------|---|--------|--------|---|
| * Blaine County | = | 7.83% | 1-Loc: | WW, SW, DUR, Vars |
| * Chouteau County | = | 82.53% | 2-Loc: | WW & SW Vars & Sawfly |
| * Hill County | = | 0.00% | 0-Loc: | WW Sawfly & WW Sawfly Insecticide |
| * Liberty County | = | 4.82% | 1-Loc: | SW, DUR Vars |
| * Phillips County | = | 4.82% | 1-Loc: | SW, DUR Vars + 3 Spring Crop Demos by M.Manoukian |

* Denotes counties traditionally served by NARC-Agronomy (Current off-station plot inventory for Chouteau County is abnormally high due to extensive cooperative wheat stem sawfly work at the Works' farm near Big Sandy. This site alone had 33.8% of NARC-Agronomy's total inventory of plots managed for 2018, but such is somewhat misleading due to all the breeder and entomology observation plots there.

Note: A code letter after an experiment number signifies that the trial listed was not carried through to final report status due to one or more conditions outline below. Where more than one condition was involved, the code used denote the factor most responsible.

c = experiment planned, but CANCELLED 'prior' to actual plot establishment (proposal rejection or other reasons)

d = severe DROUGHT stress not associated with treatment differences

e = stand ESTABLISHMENT problems not associated with treatment differences

f = FROST or winter injury not associated with treatment differences

g = GRANT proposal submitted / preliminary establishment only - subject to cancellation if funding not received

h = HAIL injury

i = INSECT injury

n = NATURAL calamity to include weather effects other than drought, freezing or hail

o = OTHER (human error - staff or cooperator, equipment malfunction, animal damage, vandalism, etc.)

p = PATHOGEN effects not associated with treatment differences

r = Grant proposal REJECTED 'after' significant establishment effort put forth - ie, continued in reduced format

s = SPRAY damage not associated with treatment differences

t = proposed grant project TERMINATED (after preliminary establishment) due to proposal rejection

u = undue, non-partitionable VARIABILITY

w = WEED infestation effects not associated with treatment differences

v = VIEW only - no formal data collection or analysis

x = plots in place, from previous endeavor - inactive current year, but retained for future viewing/reference

Bold Indicates the best entry within a column based on Fisher's Protected LSD at the 0.05 probability level.

Bold Indicates cultivars equal to the best entry within a column based on Fisher's Protected LSD at the 0.05 probability level.

1/ No. of Days from January 1 (160 = June 8).

2/ Volumetric yields are based on plot weights adjusted to uniform 13 percent grain moisture and 60 lbs/bu as the standard test weight for wheat.

3/ Protein values are adjusted to 13 percent grain moisture.

4/ FN is the falling number reported in seconds adjusted to 14 percent flour moisture.

5/ Sawfly rating is reported as the percentage of cut stems.

Management Information (20-3502-WW)

| | |

Check variety is Northern.

1/ See MCES Bulletin 1098 or the Plant Sciences & Plant Pathology website at <http://plantsciences.montana.edu/> for evaluation of other important variety performance characteristics to include protein, quality, disease resistance, etc. before making cultivar selection decisions.

2/ P = Private Variety, + = Protected Variety, ++ = PVP Title 5 Pending, HW = Hard White Wheat.

3/ No harvest due to spotty, poor stands unrelated to variety differences.

4/ Percent of Northern yield for the same data years as those in which a given entry was tested.

5/ 9-Yr Comparable Average = (x/y) * z where x = average yield of a given entry for years tested, y = average yield for Northern for the same years, and z = 9-Yr average yield for the check variety Northern.

Check variety is Northern.

1/ See MCES Bulletin 1098 or the Plant Sciences & Plant Pathology website at <http://plantsciences.montana.edu/> for evaluation of other important variety performance characteristics to include protein, quality, disease resistance, etc. before making cultivar selection decisions.

2/ P = Private Variety, + = Protected Variety, ++ = PVP Title 5 Pending, HW = Hard White Wheat.

3/ Percent of Northern sawfly rating for the same data years as those in which a given entry was tested.

4/ 10-Yr Comparable Average = $(x/y) * z$ where x = average sawfly rating of a given entry for years tested, y = average sawfly rating for Northern for the same years, and z = 10-Yr average sawfly rating for the check variety Northern.

Bold Indicates the best entry within a column based on Fisher's Protected LSD at the 0.05 probability level.

Bold Indicates cultivars equal to the best entry within a column based on Fisher's Protected LSD at the 0.05 probability level.

1/ No. of Days from January 1 (175 = June 23).

2/ Volumetric yields are based on plot weights adjusted to uniform 13 percent grain moisture and 60 lbs/bu as the standard test weight for wheat.

3/ Protein values are adjusted to 13 percent grain moisture.

4/ Sawfly rating is reported as the percentage of cut stems.

Management Information (20-3102-SW)

| | |

1/ No. of Days from January 1 (180 = June 28).

2/ Volumetric yields are based on plot weights adjusted to uniform 13 percent grain moisture and 60 lbs/bu as the standard test weight for durum.

3/ FN is the falling number value reported in seconds adjusted to 14 percent flour moisture.

4/ Sawfly rating is reported as the percentage of cut stems.

Bold Indicates the best entry within a column based on Fisher's Protected LSD at the 0.05 probability level.

Bold Indicates cultivars equal to the best entry within a column based on Fisher's Protected LSD at the 0.05 probability level.

Management Information (20-9802-DUR)

Seeding Date: April 29, 2020

Harvest Date: August 10, 2020

Fertility: 100-20-10-10

System: no till

Herbicide: Bromac, 16 oz/ac

Insecticide: none

Previous Crop: Chemical Fallow-Spring Wheat

Precipitation: 5.01" (seeding to harvest)

Bold Indicates the best entry within a column based on Fisher's Protected LSD at the 0.05 probability level.

Bold Indicates cultivars equal to the best entry within a column based on Fisher's Protected LSD at the 0.05 probability level.

1/ No. of Days from January 1 (176 = June 24).

2/ Volumetric yields are based on plot weights adjusted to uniform 13 percent grain moisture and 48 lbs/bu as the standard test weight for barley.

3/ Protein values are reported on a 100% dry matter basis.

Management Information (20-2102-SB)

Seeding Date: April 27, 2020

Harvest Date: August 5, 2020

Fertility: 20-40-2-2 side banded

System: no till

Herbicide: Vendetta-16oz/ac

Insecticide: none

Previous Crop: Chemical Fallow - Spring Wheat

Precipitation: 5.01" (seeding to harvest)

Check variety is Hockett.

1/ See MCES Bulletin 1094 or the Plant Sciences & Plant Pathology website at <http://plantsciences.montana.edu/> for evaluation of other important variety performance characteristics to include malting potential, disease resistance, etc. before making cultivar selection decisions.

2/ P = Private Variety, + = Protected Variety.

3/ Percent of Hockett yield for the same data years as those in which a given entry was tested.

4/ 10-Yr Comparable Average = (x/y) * z where x = average yield of a given entry for years tested, y = average yield for Hockett for the same years, and z = 10-Yr average yield for the check variety Hockett.

Bold Indicates cultivars yielding equal to the highest yielding entry based on Fisher's Protected LSD at the 0.05 probability level.

1/ No. Days from January 1 (207 = July 25)

2/ Volumetric yields are based on plot weights adjusted to uniform 8 percent grain moisture.

3/ Dep. is bird and wildlife depredation, recorded as the percentage of missing seed from the safflower heads in each plot.

*Varieties NutraSaff and STI 1401 were totally consumed by birds in 2020, so they were removed from the analyses.

Long-term check variety is Cardinal.

1/ + = Protected Variety, ++ = PVP Title 5 or Title 5 Pending.

2/ No harvest in 2017 due to poor stand and drought. No harverst in 2019 due to deer and bird damage.

3/ Varieties NutraSaff and STI 1401 w ere totally consumed by birds in 2020.

4/ Percent of Cardinal yield for the same data years as those in w hich a given entry w as tested.

5/ 8-Yr Comparable Average = (x/y) * z where x = average yield of a given entry for years tested, y = average yield for Cardinal for the same years, and z = 8-Yr average yield for the check variety Cardinal.

TABLE 22. Eight-Year Percent Oil Summary on Selected Entries from Dryland Safflower Nursery. Northern Agricultural Research Center. Havre, Montana. 2011-2020. (Exp# 7702-SA)

| 1/ VARIETY or SELECTION | No. of YEARS TESTED | Oil (%) @ 8% Seed Moisture | | | | | | | | | | AVE. for YEARS TESTED | % of CHECK Oil 4/ | 8-Yr COMP. AVE Oil 5/ |
