

TITLE: Spring Wheat

PERSONNEL: Vern R. Stewart and Todd K. Keener

Cooperators: Wheat Research Committee, MAES, MSU

USDA-ARS

Montana Wheat Research & Marketing Comm.

SUMMARY:

Advanced Yield Trial - The varieties MT 8289, Ward and NK 2631 all yielded above 100 bu/a, showed low levels of Septoria infection and were resistant to leaf rust, powdery mildew and lodging.

Western Regional Nursery - Sixteen spring wheat varieties significantly out-yielded Owens, the check variety. Most of those varieties were resistant to both leaf rust and powdery mildew.

INTRODUCTION:

In an effort to continually test new and improved spring wheat varieties in western Montana variety nurseries are evaluated annually at the Northwestern Agricultural Research Center. These nurseries, through accumulated years of testing, are the proving grounds for all Montana recommended spring wheat varieties.

RESULTS:

Advanced Yield Trial - Five varieties yielded significantly greater than Newana, the check variety (77 bu/a), with three of those topping 100 bu/a (MT 8289, Ward and NK 2631). Five varieties also yielded significantly less than Newana, among those being Lew, Fortuna and Thatcher.

Test weights ranged from 46.5 to 57.1 lbs/bu. Fourteen varieties were significantly higher in test weight with Ward being the only variety with a significantly higher yield also. Test weights were slightly below normal due to foliar diseases.

Lodging was moderate to severe in seven varieties. Any variety with lodging percent or severity greater than 19% and 1.56 respectively was significantly different when compared to Newana, which had no lodging. As would be expected more severe lodging was seen in plots with low yields (Lew, Fortuna, Thatcher and MT 8043).

Heading dates varied by variety and since Newana heads a little later than most varieties there were thirty-one entries which were significantly different in heading (earlier).

Leaf rust was light throughout the trial yet five varieties showed moderate to severe susceptibility to that disease. Marberg, Thatcher, MT 8228 and MT 8043 were heavily infested with rust.

Septoria was prevalent in this study and was recorded in every variety. Four varieties showing a significantly less reaction to Septoria, as compared to Newana, were Ward, Crosby, Vic and Butte.

Results (con't)

Powdery mildew was very light this year. Owens showed the highest level of infection (significantly greater in comparison to Newana) of mildew with Waverly and MT 8286 showing moderate reactions.

Western Regional Nursery - Sixteen varieties (ranging from 76.4 bu/a to 92.7 bu/a) yielded significantly higher than the check variety, Owens (57.8 bu/a). Only one variety yielded so low as to be significantly different from the check and that was Federation at 34.3 bu/a.

Test weights were generally low for this nursery with the average being 48.2 lbs/bu. Eight varieties had significantly higher test weights, seven of which also had better yields. Waverly, UT 541815, and Federation had significantly lower test weights.

Approximately half of the entries showed some lodging during the season with five varieties being severely affected.

Leaf rust was not as prevalent in this nursery yet was recorded at high levels in seven varieties, most of which were poor yielding varieties. Septoria was severe in this nursery and recorded in all varieties. The varieties showing the lowest Septoria infection were ID 247 and OR 750573 which had mild reactions. Eighteen varieties showed resistance to Powdery mildew. Of the remaining entries five had high susceptibility to powdery mildew (Table 2).
