Station Activities and Developments

The "dust bowl" conditions of 1985 prompted the use of chemical fallow on station fields instead of tillage to preserve an already short supply of stubble. Soil blowing during the winter was especially bad around the new office building, where the soil had been left bare from construction activities. Trees and streambank wheatgrass were planted around the office building during the spring. The trees included green ash, russian olive, blue spruce, and scotch pine.

Plans to fence the east boundary of the station to keep out trespass livestock were not carried out, as the soil was too dry to drive fence posts.

A weather station, consisting of an instrument shelter and rain gauge, was set up to allow more detailed climate monitoring. Readings include minimum and maximum daily temperatures, rainfall, and evaporation.

1985 was the 3rd dry year in a row; with growing season rainfall far below normal and soil reserves depleted. Crops were severely affected by the drought, with grain yields ranging from 5 to 30 bu/acre. Most winter wheat did not survive the dry conditions. Insects became unusually troublesome, requiring spray applications several times to prevent crop loss to cutworms, grasshoppers, and blister beetles (on pulse crops). Additionally, sawflys were an increasing menace.

There were approximately 49 experiments conducted this year, 29 of which were off station.

Field tours were held at some of the off-station plots, including Cut Bank, July 11; Whitlash, July 2; and twice at Fairfield, July 30 and August 16. The general station field day was cancelled due to drought, but approximately 35 visitors from Jack Baringers IPM group toured the plots on July 10.

A special grant of \$38,000 from the Yielder Company, which was partially matched with \$20,000 from the Montana Wheat Research & Marketing Committee and \$15,640 from the Montana Agr. Experiment Station was given to the three Research Centers at Conrad, Havre, and Moccasin to purchase a Yielder No-Till Drill, transport trailer, and truck. The 3 Research Centers will work together as a team, establishing plots in the Triangle Area. The truck was a used highway department snowplow rig, in good condition; and was purchased for \$6429.

Research Center staff during 1985 included Greg Kushnak, Superintendent; Research Technicians Ron Thaut and Larry Christiaens; and Gladys Dunahoo, secretary (half time). Dr. Alice Jones resigned last winter to take a job in Nebraska. Hiring of a scientist to replace Alice is underway.

The Advisory Committee held a meeting on June 11, with MAES Director Dr. Jim Welsh, regarding the hiring of a new scientist to replace Alice Jones. The committee felt that the new scientist should be oriented toward general agronomy and soils, rather than confined to a specific subject area.

Following is a list of Advisory Committee members:

Past Members

Richard Page, Bynum Teton Co.	1977-79
Dave Shane, Floweree, Cascade Co.	1977-82
Vade Hamma, Brady, Chouteau Co.	1977-82
Wilson Hodgskiss, Choteau, Teton Co.	1977-83
Don Buffington, Ledger, Liberty Co.	1977-83
Jerry Swenson, Cut Bank, Glacier Co.	1977-83
Karl Ratzburg, Ledger, Toole Co.	1977-84
Joe DeStaffany, Conrad, Pondera Co.	1977-84
Dale Vermulm, Cut Bank, Glacier Co.	1977-84
Jack Baringer, Conrad, Pondera Co.	1977-84
Bob LongCake, Shelby, Toole Co.	1982-84
Randy Weaver, Cut Bank, Glacier Co.	1982-84
Paul Kronebusch, Conrad, Pondera Co.	1977-85

Re-appointed through 1985

Arnold Gettal, Power, Teton Co.
Gary Iverson, Sunburst, Toole Co.

New appointment through 1985

Ted Neuman Vaughn, Cascade Co.
Bill McLean, Brady, Chouteau Co.

New appointment through 1986

Leif Larson, Choteau, Teton Co.

New appointment through 1987

Miles Lewis, Cut Bank, Glacier Co.
Bruce Bradley, Cut Bank, Glacier Co.
Joe Larsen, Galata, Toole Co.
Bob Layne, Valier, Pondera Co.
Richard Thielges, Chester, Liberty Co.
Bill Richter, Choteau, CES Representative (ex-officio)

New appointment through 1988

Mark Grubb, Pondera Co.

Climatic summary for the 1985 calendar year at the Western Triangle Research Center, Conrad, MT.

	1985 Month												
	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total
Precipitation (inches)	.16	.33	.75	.83	1.98	.80	.16	2.79	4.95	.77	.73	.17	14.42
Mean Temperature (°F)	--	--	--	--	55.6	59.2	71.1	60.7	46.4	40.1	15.0	23.9	--
Last killing frost in spring *	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----
First killing frost in fall *	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----
Frost free period	-----	-----	-----	-----	-----	-----	-----	-----	-----	112 days	-----	-----	-----
Maximum summer temperature	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	July 11 (96°)	-----	-----
Minimum winter temperature	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	not available	-----

* In this summary, 32°F is considered killing frost.

Soil moisture probe depth = 18" on fallow (or 3" available water); 15" on stubble (or 2.5" available water).

TITLE: Winter Wheat Investigations

YEAR: 1985

LOCATION: Western Triangle Research Center, Conrad, Montana

PERSONNEL: Gregory D. Kushnak, Ron Thaut, and Larry Christiaens - Research Center, Conrad; Dr. Allan Taylor, MSU, Bozeman.

Winter wheat variety test plots at the "Knees" between Fort Benton and Brady, at Chester, and on Station failed to establish due to dry soil in 1985. In contrast, fairly good plot yields were obtained in the Dutton area, and also south of Great Falls near Eden. The 1985 Dutton data are presented in table 1, with a 3-year summary in table 2. Redwin and MT 8003 were among the top yielders in 1985, as well as having the best 3-year average. MT 8003 is a selection from Redwin, and shows a great deal of promise. Release and naming of MT 8003 is approximately 2 years away, pending a successful seed increase. Neeley was also a top yielder in 1985, but only one year of data was available at this location.

A seeding rate study was also conducted at Dutton, and the data are presented in another section of this report in tables 32 and 33.

The variety data from Eden are presented in table 3, with a 2-year summary in table 4. In addition to MT 8003, varieties with superior performance over the last two years included Centurk, Cree, Neeley, Winridge, and Cheyenne. Cree is a shatter resistant Cheyenne.

Seed dates : September 27, 1983, September 17, 1984.

* Cree is a shatter-resistant Cheyenne.

TITLE: Spring Wheat Investigations

YEAR: 1985

LOCATION: Western Triangle Research Center, Conrad, MT

PERSONNEL: Gregory D. Kushnak, Ron Thaut, and Larry Christiaens, Research Center, Conrad; Larry Alexander, USDA-SEA, MSU, Bozeman

Dryland spring wheat variety trials were grown near Conrad, Whitlash, Cut Bank, Choteau, Great Falls, and Sun River; and an irrigated trial at Fairfield. Data for 1985 are presented in tables 5, 7, 9, 10, 11, 13, 14, 15, 16, and 17; with multiple year averages in tables 6, 8, and 12. Data for variety evaluations on no-till recrop are presented in tables 7, 8, and 10.

Drought had a considerable impact on the varieties; as indicated by the 5 to 24 bu/acre dryland yields, and low test weights. Soil moisture and rainfall amounts are given in the table footnotes.

Sawflies influenced yields somewhat at all locations except Great Falls and Sun River. The new sawfly resistant, semidwarf 'Glenman' ranked fairly high for yield at all locations; which was consistent with previous years' tests. However, Glenman was below average in test weight, which would be a serious problem in dry years. The experimental sawfly resistant selection MT 7926 showed a yield advantage over Lew at some locations, but had a tendency to shatter. This line will be re-selected in efforts to obtain a shatter resistant type.

TITLE: Barley and Oat Investigations

YEAR: 1985

LOCATION: Western Triangle Research Center, Conrad

PERSONNEL: Gregory D. Kushnak, Ron Thaut, & Larry Christiaens, Research Center, Conrad; Dr. Tom Blake, MSU, Bozeman

Dryland barley variety trials were grown near Conrad, Whitlash, Cut Bank, Choteau, Great Falls, and Sun River; and an irrigated trial at Fairfield. Data are presented in tables 18 - 30, and include 1985 as well as multiple year summaries. Tables 20, 21, and 23 pertain to variety evaluations on no-till recrop. Soil moisture and rainfall amounts are included in the footnotes to the tables.

Drought influenced the varieties considerably, and none of the dryland locations produced acceptable malting grades. Harrington approached malting grade on fallow at Whitlash, but this was offset by a low yield ranking. Of the malting types, Piroline was the most consistent at maintaining a high relative yield over locations.

The two-row feed variety Bowman was the top yeilder at all dryland locations. This variety may be specifically adapted to drier than normal conditions, and should be considered with caution for higher moisture conditions until more tests are conducted. 'Gallatin', a 2-row feed variety, ranked high at most locations; which is consistent with the previous year's tests.

On irrigated, the top yielding feed variety was Gallatin, followed closely by Karla, a 6-row malt type, at 122 bu/acre. The next highest yielding malt type was Clark at 103 bu/acre.

Oat varieties were grown on dryland at the Sun River location; and showed a definite response to drought, with yields from 16 to 30 bu/acre (table 31). Otana is the currently recommended variety with a status of superior yield and test weight. This is supported by the data in table 31. Monida is a new release with superior yield than Otana under favorable moisture, but with a test weight between Otana and Cayuse.

Previous crop: Tillage fallow.

Fertilizer: 70 lbs actual N as NH₃ during summer of 84.

PROJECT TITLE: Small grain seeding rate studies.

PROJECT LEADER: Gregory D. Kushnak, Western Triangle Research Center,
Conrad, MT.

Results:

Seeding rate studies included two varieties of winter wheat on dryland fallow near Dutton (tables 33-34); dryland spring wheat and barley on no-till recrop vs. fallow at Conrad (tables 34-37); and spring wheat and barley under irrigation (tables 38-39). The rates tested are listed in the data tables, as seeds per foot and pounds per acre.

Growing conditions for the dryland tests were regarded as severe drought. The optimum range for dryland seeding rate was 15 to 20 seeds/sq foot, with 20 generally the best rate. However, the differences among rates were only suggestive, as none were considered statistically significant.

On the irrigated tests, the only definite trend was that 10 seeds/sq foot was below optimum.

Table 32. Seeding rate trial on two varieties of winter wheat grown on fallow near Dutton, 1985. Mont. Agr. Expt. Sta; Western Triangle Research Center, Conrad, MT.

Variety	Seed rate *		Plant height in.	Yield bu/a	Test wt.	% Protein

Growing season precipitation : 3.6" + 3" soil water

PROJECT TITLE: Oilseed and pulse crop evaluation under no-till and recrop conditions.

PERSONNEL: Gregory D. Kishnak, Ron Thaut, & Larry Christiaens, Western Triangle Research Center, Conrad, MT.

INTRODUCTION/OBJECTIVES:

Oilseed and pulse crops in rotation can benefit grain production (soil amelioration, pest cycle disruption, etc.). The production potential of various oilseed and pulse crops has been determined for fallow systems, under average management levels, in the Western Triangle area. This study sought to determine production potential of these crops on recrop and no-till conditions, where they will most likely be grown in rotation with grain.

Results:

Oilseed and pulse crop experiments included the comparison of safflower varieties on recrop vs. fallow; the evaluation of oleic oil safflower lines for alternate energy sources; the evaluation of seeding rates for sunflowers and several pulse crops on recrop, tillage fallow, and no-till chemical fallow; and the evaluation of lupine varieties on no-till chemical fallow. Locations involved were Dutton and Conrad, both of which experienced drought conditions.

Safflower varieties ranked the same for yield on both recrop and fallow conditions (table 46). The selections 81B6078 and 81B3565 are potential replacements for Hartman and S-208, respectively; with 81B3565 intended primarily for birdseed markets. Each produced a higher yield and test weight than Hartman and S-208, respectively. Both lines were developed from the safflower breeding program at the Eastern Research Center, Sidney, MT.

The safflower yields on fallow were lower than for recrop, possibly due to soil drying from two preseeding tillage operations on the fallow. The recrop received only one tillage operation to incorporate Treflan.

The oleic safflower study was conducted in cooperation with the Eastern Research Center, Sidney; and oil tests are still being conducted in the lab. Agronomic data for the oleic lines are presented in table 45.

Optimum seeding rates for the pulse crops were difficult to assess, due to the drought related low yields. The rates (in both seeds/sq. foot and pounds/acre) and the corresponding agronomic data are presented in tables 47 and 48. There appeared to be considerable interaction between rates, location, and cropping system. In general however, the optimum rates for the various crops under drought conditions were: Lentil, 11 seeds/sq. foot; Austrian Pea, 6 to 9 seeds/sq. foot; and Fababean, Pinto Bean and Garbanzo bean, 1 to 2 seeds/sq. foot.

The lupine variety trial (table 49) was grown under the same conditions as the pulse crop seeding rate trial that was reported in table 47. The data in table 49 indicate that lupine has a similar yield potential to fababean, but less than for lentil and austrian pea. Seeding rates, however, may not have been optimum for the lupine; as this is a new, unknown crop to this area. Further study will be needed to determine what rate of seeding is needed.

Data for the sunflower study are not available do to crop loss to blackbirds.

Cooperator & Location : Station

Seeding date : May 8, 1985

Previous crop : Chemical fallow, barley stubble

Fertilizer : 100# 11-51-0 with the seed

Depth of moisture probe at seeding : 18"

Rainfall : May 8 - August 1, : 2.94"

Harvest date : August 19, 1985

Insecticide : Malathion for blister beetles; Sevin for hoppers

Lupine pods turned yellow by August 1; grasshoppers removed all leaves by
August 9 when pods were still yellow and seeds green.

Table 50. Yield of peas when grown in mixture with barley and fababean, Mont.
Agr. Expt. Sta., Western Triangle Research Center, Conrad, MT.

Mixture	Height of component crop inches	Yield of component crop lbs/a	Test wt. lbs/bu
Barley +peas	23 15	1406 <u>44</u>	48.3 --
Total		1450	
Fababeans +peas	14 15	286 <u>322</u>	62.9 62.0
Total		608	

Location : Station

Seed date : May 8, 1985

Previous crop : Chemical fallow (barley stubble)

Fertilizer : 100# 11-51-0 with seed

Depth of moisture probe at seeding : 18"

Growing season precipitation : 2.94"

Barley matured 6 days later than peas, and fababean approximately 10 days later.

Seeding rates : Peas = 6 seeds/sq.ft.; Fababean = 2 seeds/sq.ft.;
Barley = 6 seeds/sq.ft.

Barley stand was much too thick, and caused severe competition for the peas.

The pea vines, however, did support themselves on the barley stems.

The pea vines tended to avoid fababean stalk.

Cooperator & location : Ross Peace, N. of Fairfield

Seed date : June 28, 1984

Harvest date : first cut June 25; second cut August 7, 1985

Fertilizer : 100# 11-51-0 with the seed

Previous crop : Barley 1983; verticillium infected alfalfa 1982.

No irrigation on first cutting

Second cutting irrigated twice.

* 12% moisture basis

Cooperator and Location : Ross Peace, N. of Fairfield

Seeding date : June 13, 1983

Fertilizer : 100# 11-51-0 with the seed

Previous crop : Alfalfa torn out in 1982 (Verticillium wilt infected)

* First cutting in 1985 was not irrigated

1/ 12% moisture basis

Table 54. Band application of Roundup on native range to simulate mechanical chiseling. Mont. Agr. Expt. Sta.; Western Triangle Research Center, Conrad, MT.

	Yield lbs./ acre *	% Forbs *	% Grasses *
Treated area	1,488	73.5	26.5
Non-treated area	810	68.2	31.8

Cooperator and location : Bill Jones, west of Bynum

Sprayed : July 8, 1982

Chemicals used : Roundup

Method of application : Conventional flat fan spray nozzles spaced 18" apart and lowered to a height of approximately 10" above ground level making a band of spray 6" wide.

Rate of application : 1 quart/acre total chemical (concentrated in bands to equal approximately 3 quarts/acre).

Date of cutting : June 27, 1985

* wet weight basis

Rainfall was much below normal during the period 1983-1985.
